## dataSOFT ViewNode & ReportNode

For clients who utilize our dataSOFT SUITE version of software, Contec Systems is pleased to announce our new ViewNode and ReportNode Utilities.

Any computer connected to the same TCP/IP Network as the primary DAHS computer can now display real-time emission and plant data as well as generate any system reports.

Contec's ViewNode Utility - No longer is there a need to physically rely on the primary DAHS computer to check on real-time system information, initiate a calibration, check if all of your analyzers passed their daily calibration, or view real-time trends. The ViewNode utility provides you with this solution.

ViewNode allows you to display real-time system information on other network computers. This allows your plant to view information at multiple computers throughout your facility wherever the dataSOFT ViewNode utility is installed.

Contec's ReportNode Utility – Want the ability to sit at your desk and generate all of your required reports? The ReportNode Utility provides you with this solution.

ReportNode gives you the ability to generate any of your configured historical reports on other computers other than the primary DAHS computer. The primary DAHS still acts as the main data-gathering tool. The ReportNode utility gathers all information from the primary DAHS database for all its historical information.

We've listened to many clients say "I want to see the DAHS screens on my own computer" and "I want to see if any of my emissions are in alarm" and "I want to have the ability to print my reports at my local printer". You asked, and we responded.

Please contact the factory for more details and pricing information, or to upgrade your existing software version to the SUITE version to take advantage of these new features.
